MATHS 104: Mathematics for Business II

# Differential equations

## Definition 1

The *Initial value problem* is the problem of finding the function  $y$  given the derivative  $y'$  and *initial condition*  $y(a) = b$ .

**Idea:** Integrate  $y'$  and find the general antiderivative and then substitute  $x = a$  and  $y = b$  to find the function  $y$ .

**Note:** The initial value problem is subclass of a bigger problem in mathematics called solving **differential equations**.

## Example 2

If  $y$  satisfies the given condition, find  $y(x)$ .

$$\frac{dy}{dx} = 6x^2 - 8x + 12 \text{ and } y(0) = 2$$

Solution: We integrate to find  $y$ .

$$y = \int (6x^2 - 8x + 12) dx$$

$$y = 2x^3 - 4x^2 + 12x + C$$

$$2 = 2(0)^3 - 4(0)^2 + 12(0) + C$$

$$2 = C$$

$$y = 2x^3 - 4x^2 + 12x + 2$$

### Exercise 3

If  $y$  satisfies the given condition, find  $y(x)$ .

$$\frac{dy}{dx} = 9x^2 - 4x + 5 \text{ and } y(-1) = 0.$$

Dr. Abdulla Eid

## Example 4

If  $y$  satisfies the given condition, find  $y(x)$ .

$$y'' = 6x + 4 \text{ and } y'(0) = 1, y(0) = 5$$

Solution: We integrate to find  $y$ .

$$y' = \int (6x + 4) dx$$

$$y' = 3x^2 + 4x + C$$

$$1 = 3(0)^2 + 4(0) + C \rightarrow C = 1$$

$$y' = 3x^2 + 4x + 1$$

$$y = \int (3x^2 + 4x + 1) dx$$

$$y = x^3 + 2x^2 + x + D$$

$$5 = y(0) \rightarrow D = 5$$

$$y = x^3 + 2x^2 + x + 5$$

## Exercise 5

If  $y$  satisfies the given condition, find  $y(t)$ .

$$\frac{d^2y}{dt^2} = \cos t + \sin t \text{ and } y'(\pi) = 0, y(\pi) = 1$$

Dr. Abdulla Eid

## Example 6

If  $y$  satisfies the given condition, find  $y(x)$ .

$$\frac{dy}{dx} = e^{-x} + \frac{1}{\sqrt{1-x^2}} \text{ and } y(0) = \pi$$

Solution: We integrate to find  $y$ .

$$y = \int \left( e^{-x} + \frac{1}{\sqrt{1-x^2}} \right) dt$$

$$y = -e^{-x} + \sin^{-1} x + C$$

$$\pi = -e^{-0} + \sin^{-1}(0) + C$$

$$\pi = -1 + 0 + C$$

$$\pi - 1 = C$$

$$y = -e^{-x} + \sin^{-1} x + \pi - 1$$

## Exercise 7

If  $y$  satisfies the given condition, find  $y(x)$ .

$$y' = \frac{3}{1+x^2}, \quad y'(1) = 5$$

Dr. Abdulla Eid
