AL-Kashi

- Ghiyath al-Din Jamshid Mas'ud Al-Kashi
- ca. 1380 (Kachan, Iran) - 1429 (Samarkand , Uzbekistan)
- He is a scientist at an observatory and learning center established in Samarkand by the prince Ulugh Beg, a grandson of the Mongol conqueror Tamerlane.” (Zhang,C.2011)
- He “wrote numerous works in Persian and Arabic, contributing to mathematics and astronomy .” (Zhang,C.2011)
- His book “Miftah al-Hussab” (Key to Arithmetic) “provides sufficient knowledge of mathematics for those who are working on astronomy, surveying, architecture, accounting and trading.”

His Achievements

- “He wrote important texts applying arithmetic and algebra to problems in astronomy, measurement and accounting.
- He worked with binomial coefficients. $\binom{n}{k} = \frac{n!}{k!(n-k)!}$ for $0 \leq k \leq n$.
- He invented astronomical calculating machines.
- He invented the Law of Cosines.
- Approximated π into 16 digits .
- invention of decimal fractions (though he worked mainly with sexagesimal-60 fractions)” Allen,J.(2015).

Approximate π into 17 digits

Al-Kashi measured the circumference of an equal sided polygon that is surrounded by a circle, and another that is surrounded by a circle that has $3 \times 2^{28} = 805306368$ sides

He presumed that the circumference of a circle is equal to the median of the two results, and he arrived at this conclusion (in the sexagesimal system): $p = 3;8, 29, 44, 0, 47, 25, 53, 7, 25$

He transformed it into the decimal system:

$$p = 3.14159265358979325$$

Multiple algorithms

Al-kashi described five multiplication algorithms in his Key to Arithmetic

Law Of Cosines

- Used to calculate one side of a triangle the angle of the opposite side and the other sides are known.
- Euclid's elements (c.300 B.C.) has the main concepts that lead to this law

Théorème d'Al-Kashi

- Al Kashi provided accurate trigonometric tables.
- He also expressed the theorem in a suitable form for the modern usage.
- In French , the law of cosines is named **théorème d'Al-Kashi** after al-kashi unification of the exiting works on the subject.
